

Introduction to Lab SIRD Model

José Nelson Amaral

The SIRD Model

A compartmental model used to simulate the spread of infectious diseases.

At any given moment, each member of the population belongs to one of the following compartments:

- **Susceptible:** at risk of contracting the disease
- **Infectious:** currently suffering from the disease
- **Recovered:** recovered from the disease
- **Deceased:** killed by the disease

Linear Congruential Generator

The diagram illustrates the Linear Congruential Generator (LCG) formula, $X_i = ((a * X_{i-1}) + c) \% m$, with labels and arrows identifying its components:

- Generated Number**: Points to X_i .
- Seed Value**: Points to X_{i-1} , with the text $(X_0 = \text{Initial Seed})$ above it.
- Multiplier**: Points to a .
- Increment**: Points to c .
- Modulus**: Points to m .

The formula is displayed as:

$$X_i = ((a * X_{i-1}) + c) \% m$$

Linear Congruential Generator (Example)

$X_0 = 4$
$a = 3$
$c = 7$
$m = 10$

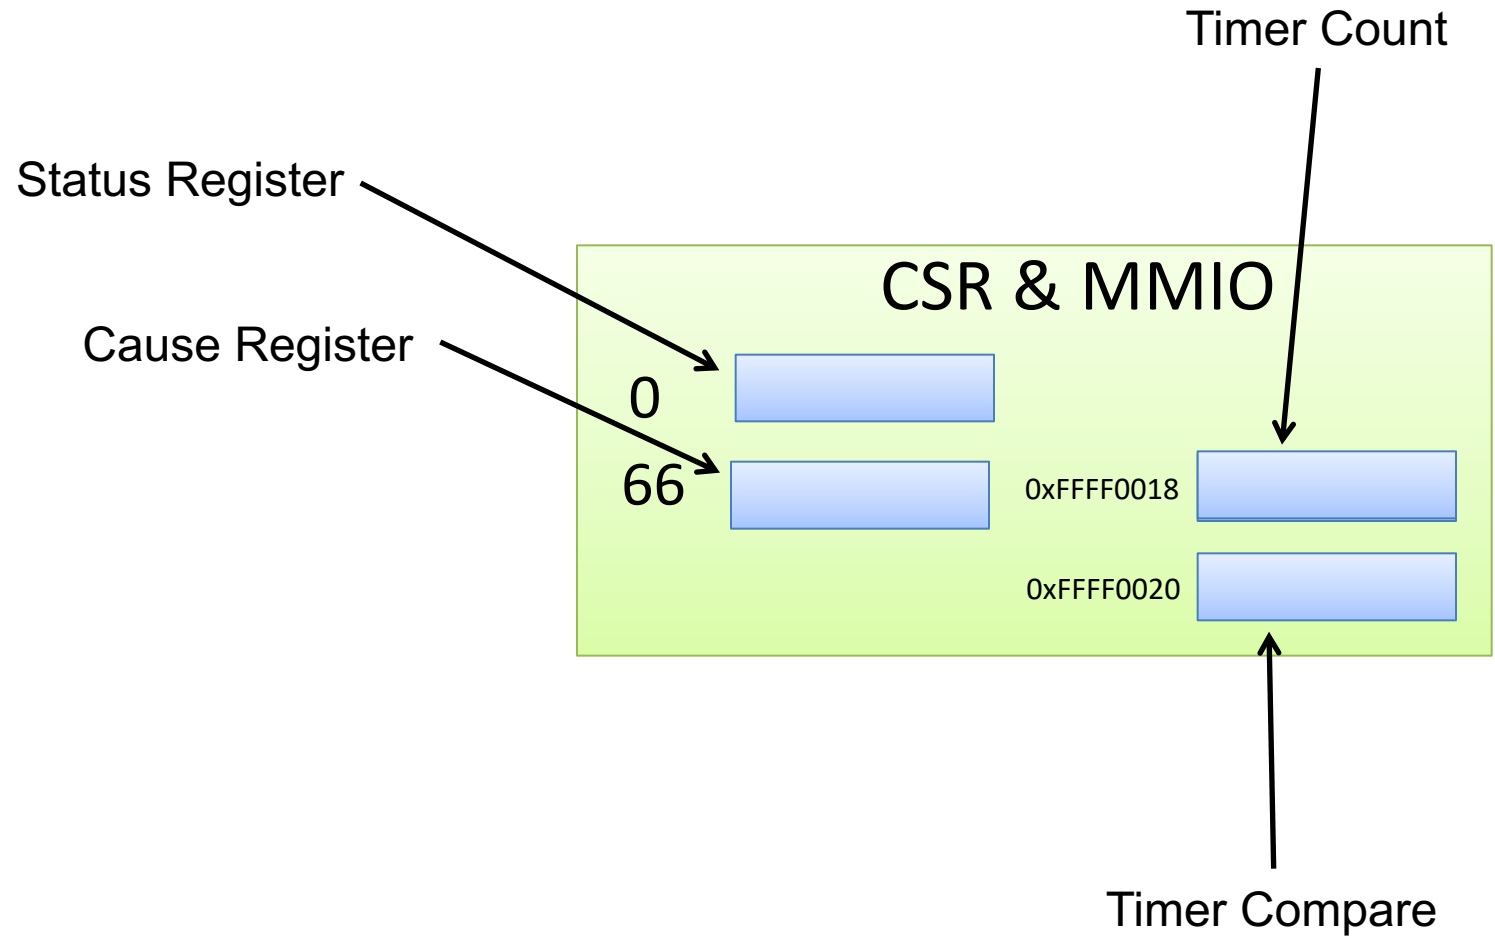

a , c , and m are constants in the generator

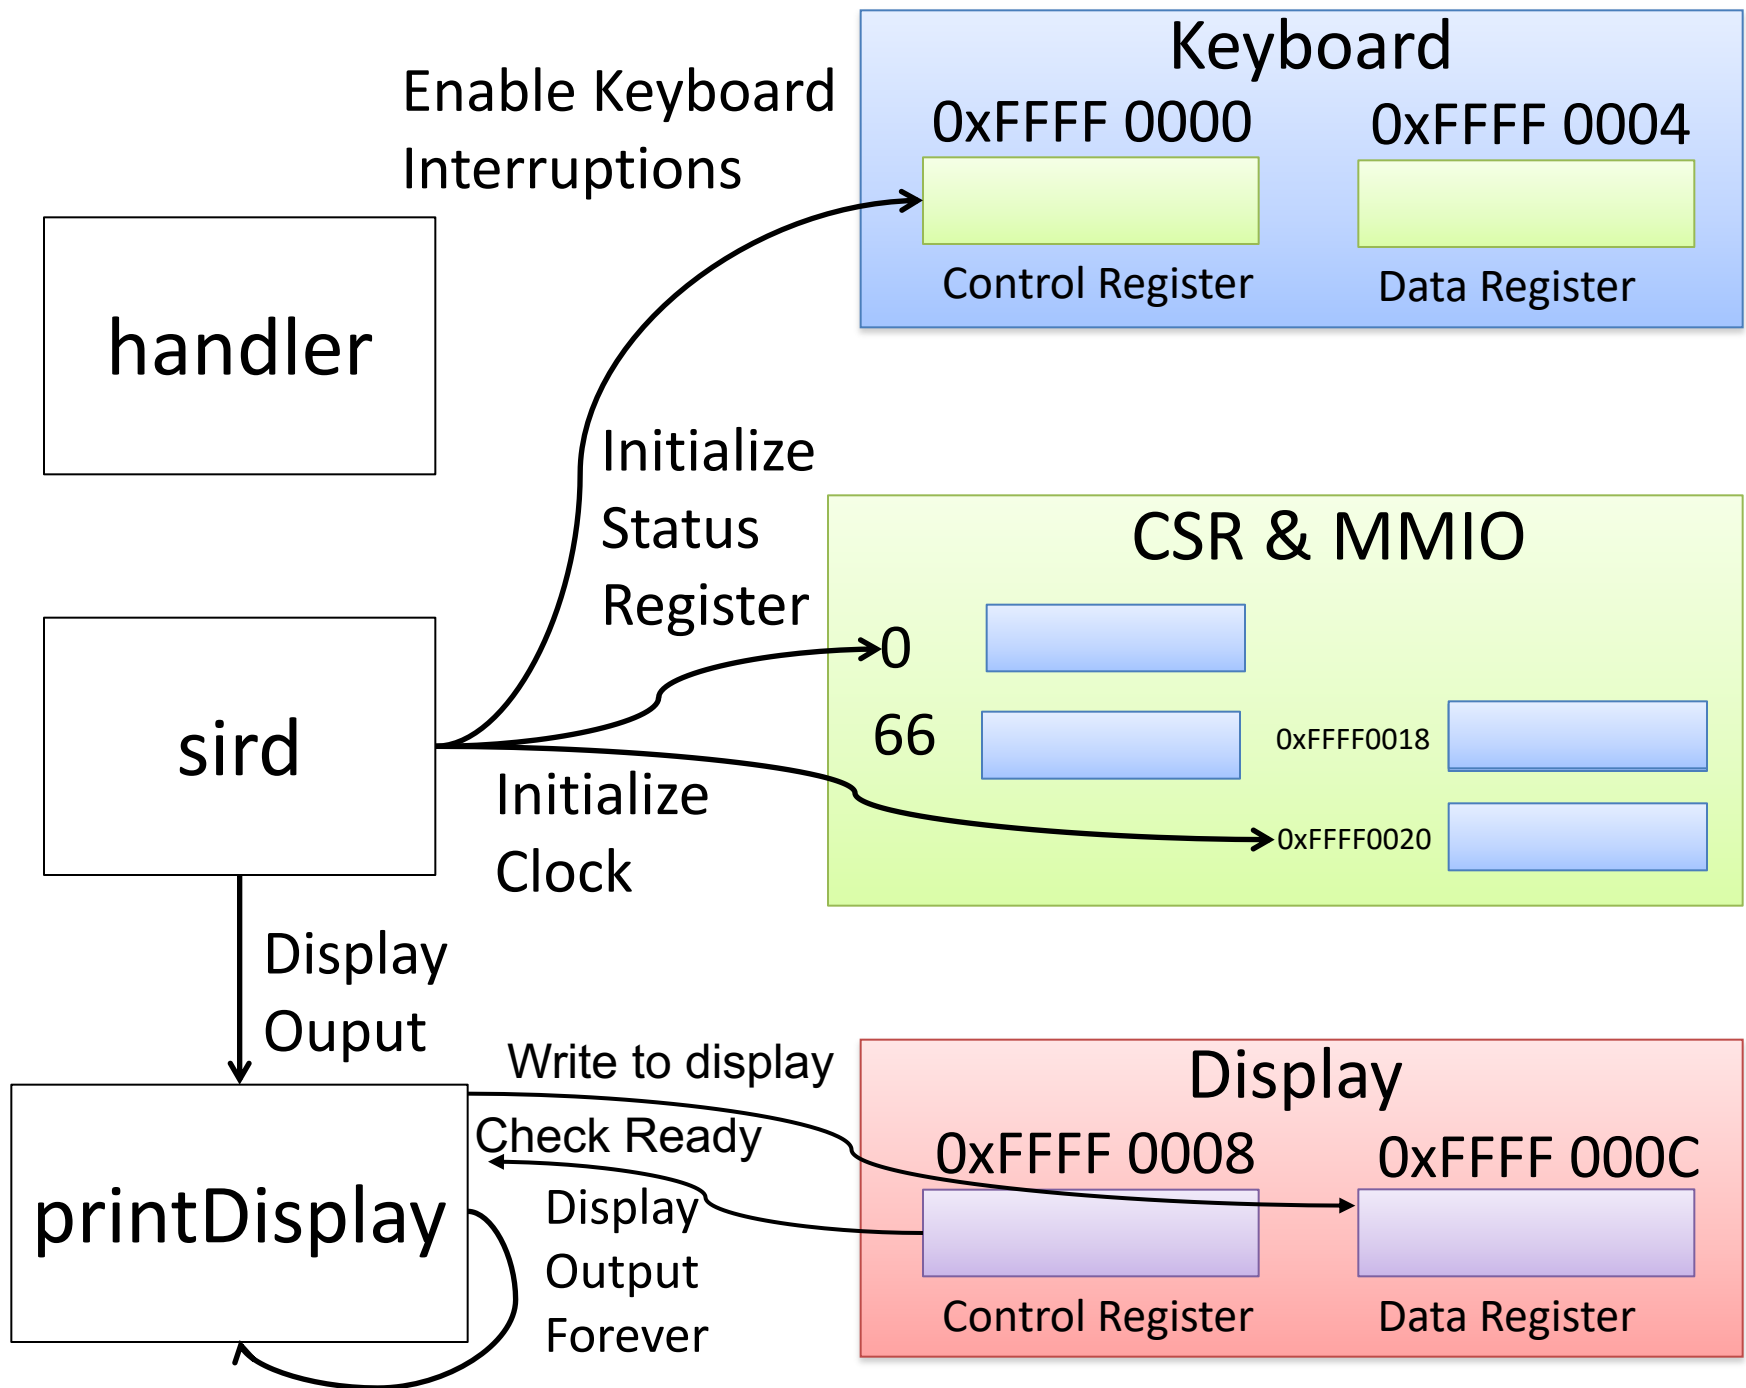

$$X_2 = ((a * 4) + c) \% m$$
$$= 9$$

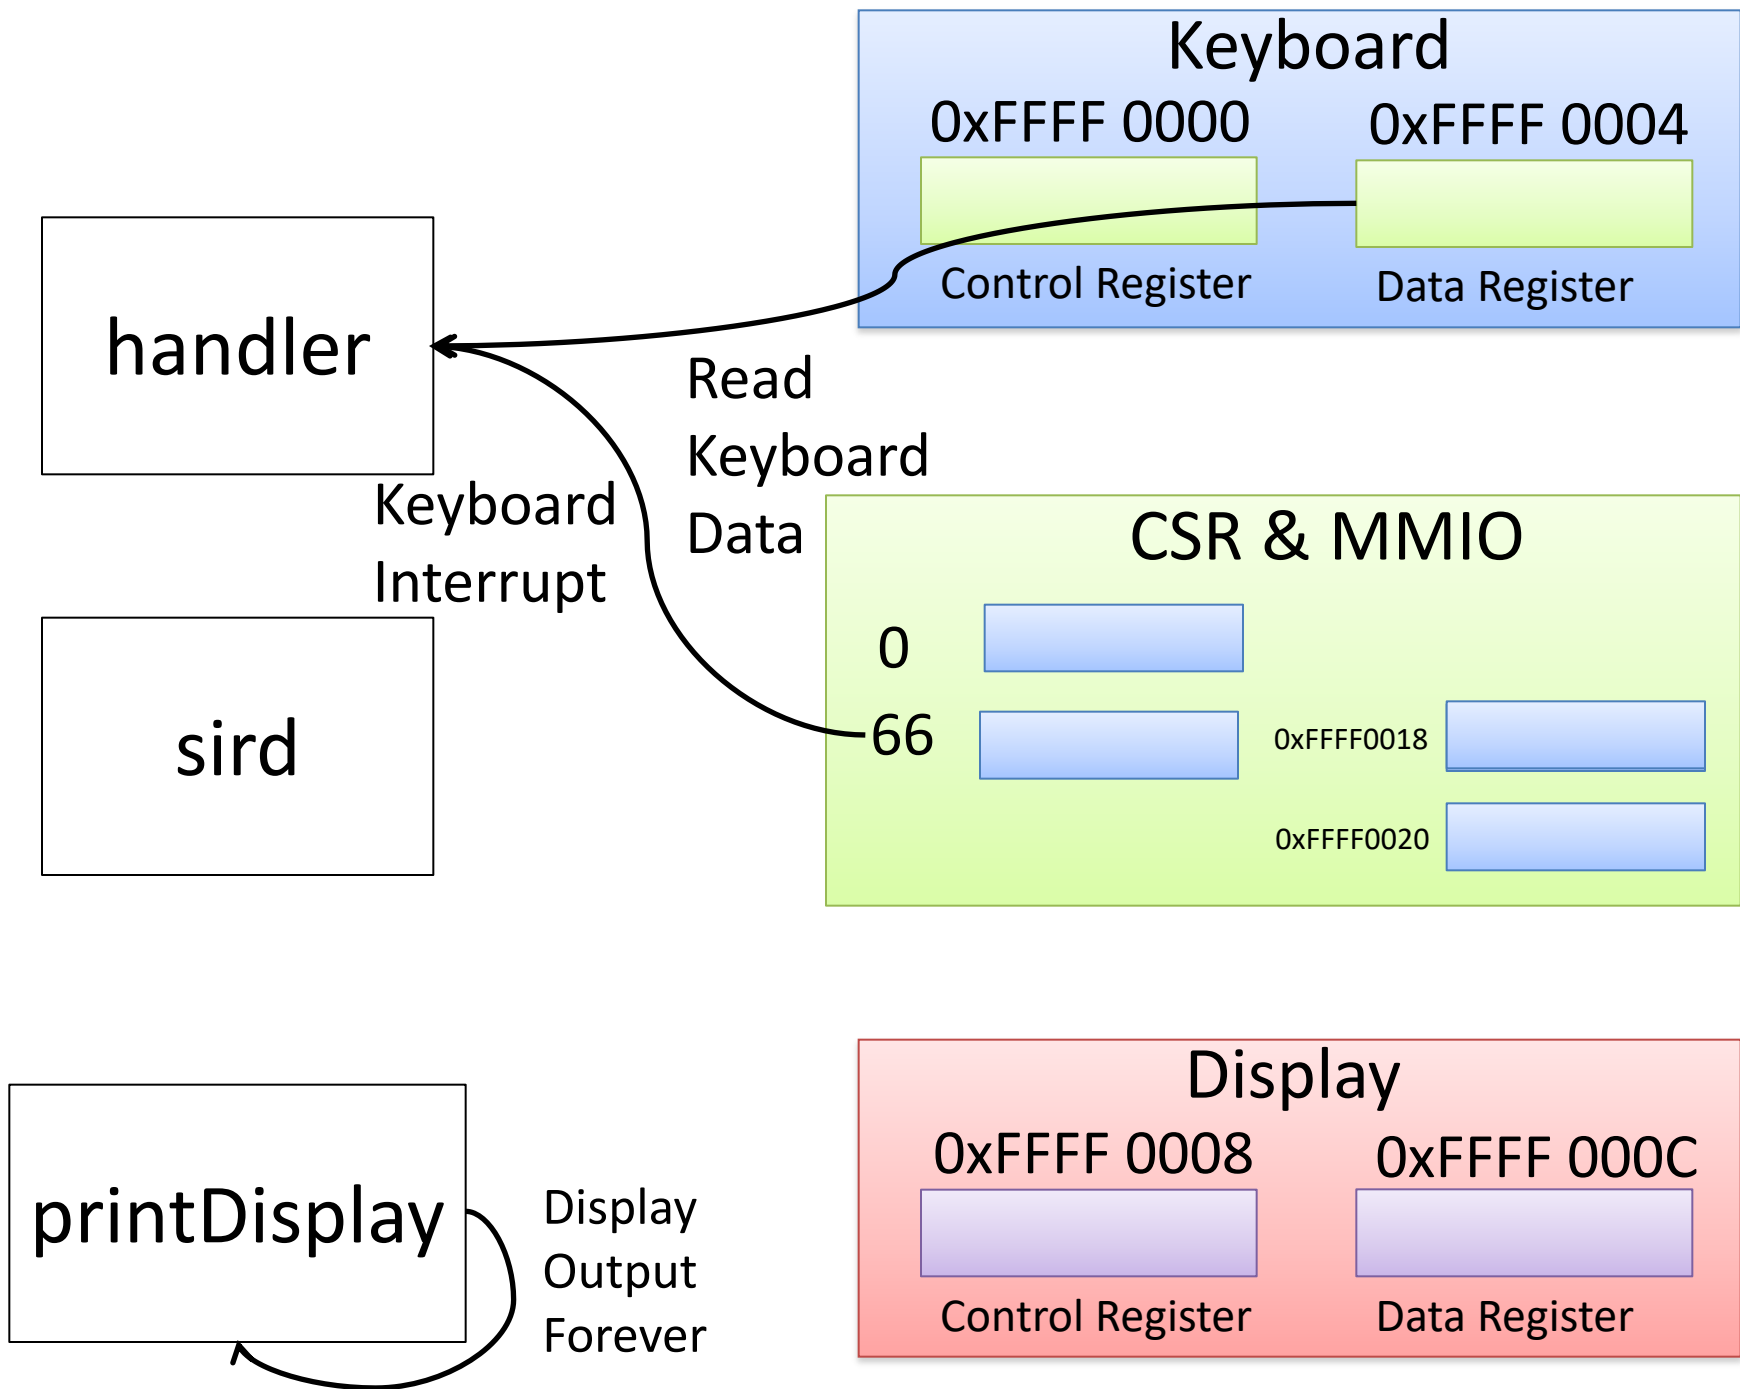

First Randomly
Generated Number

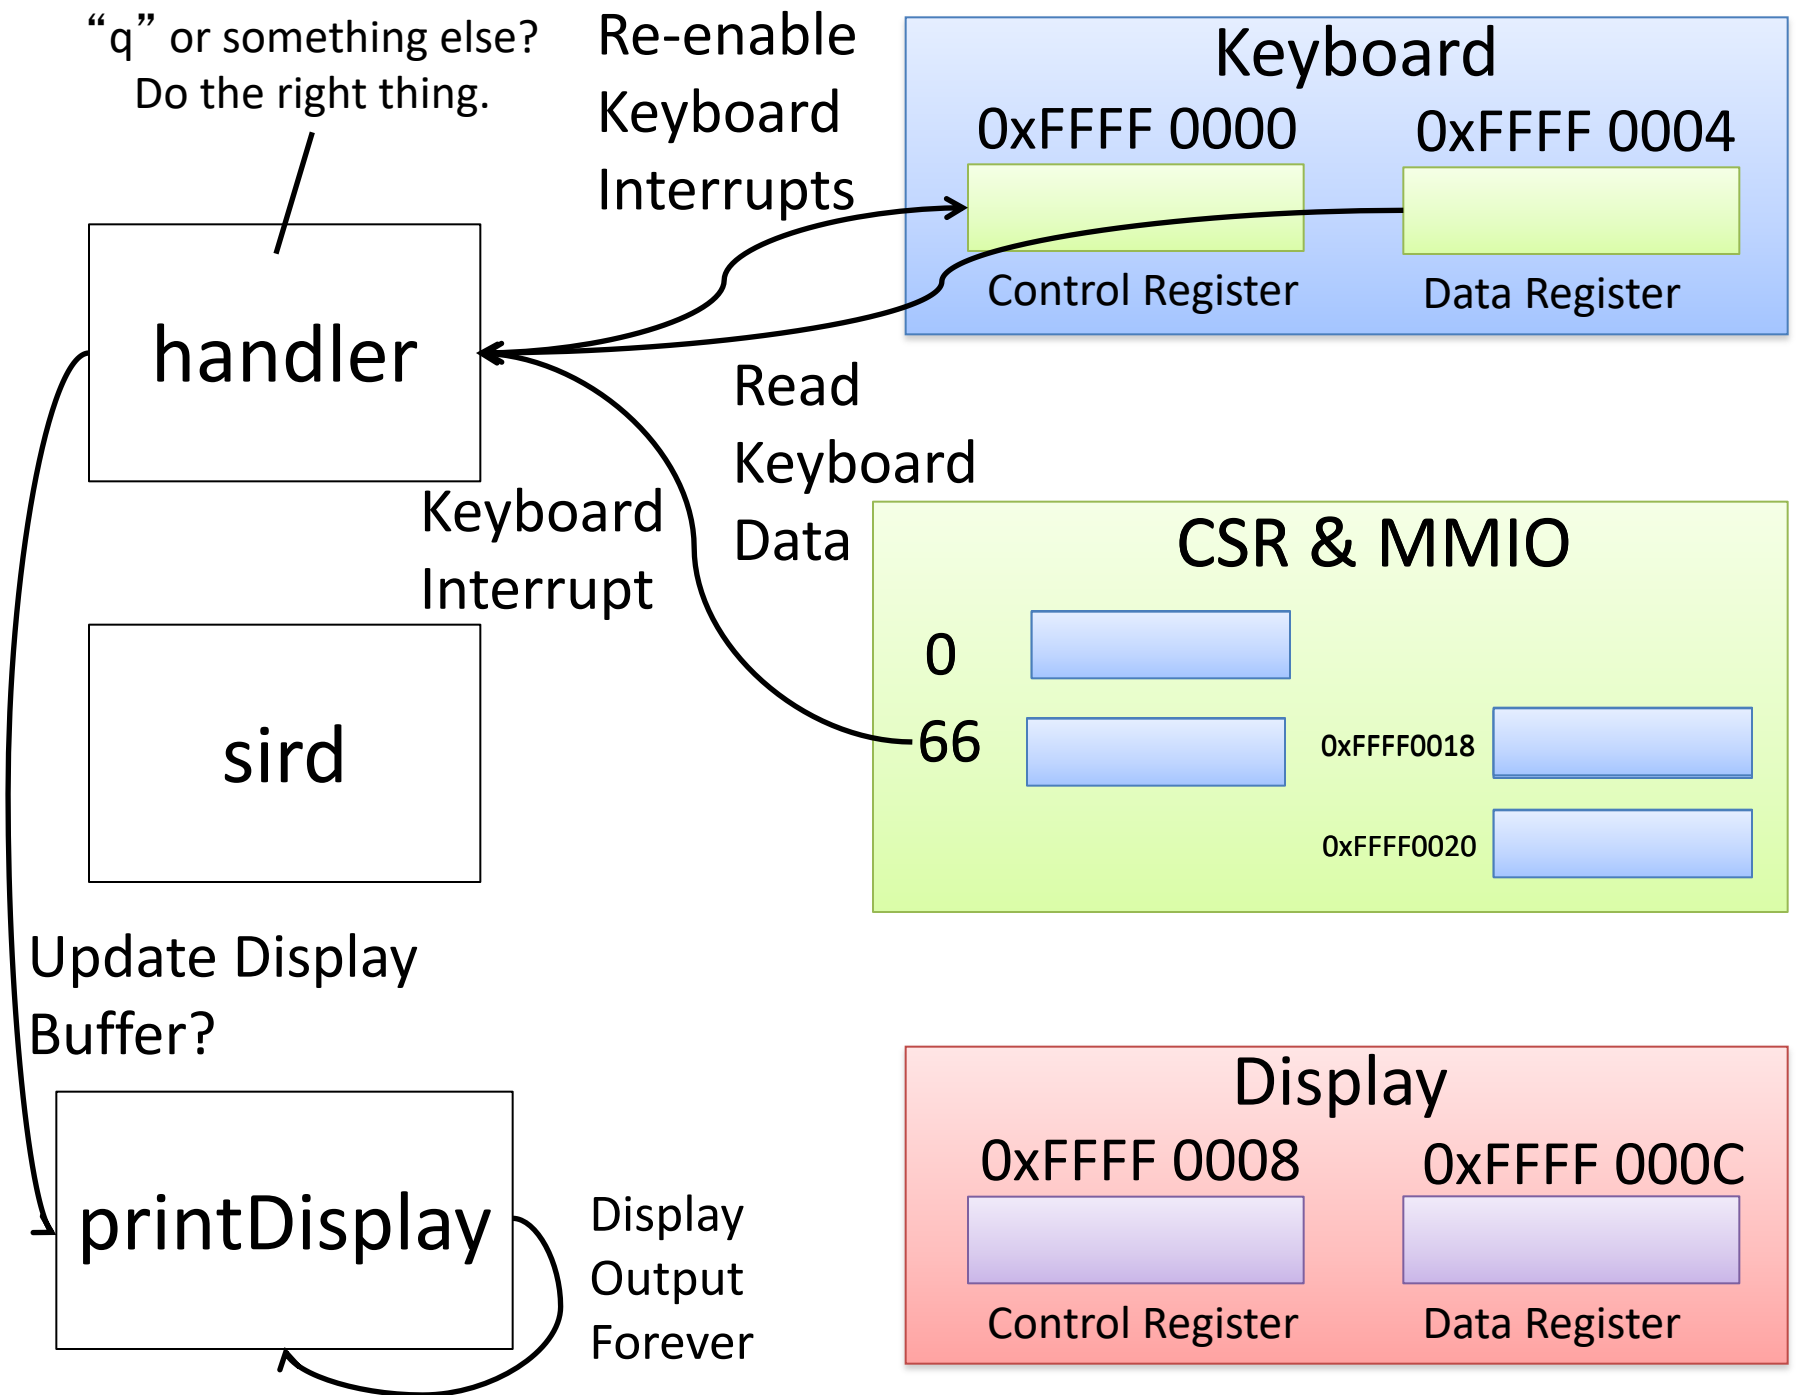

The previously generated number is used as the seed to calculate the next random number

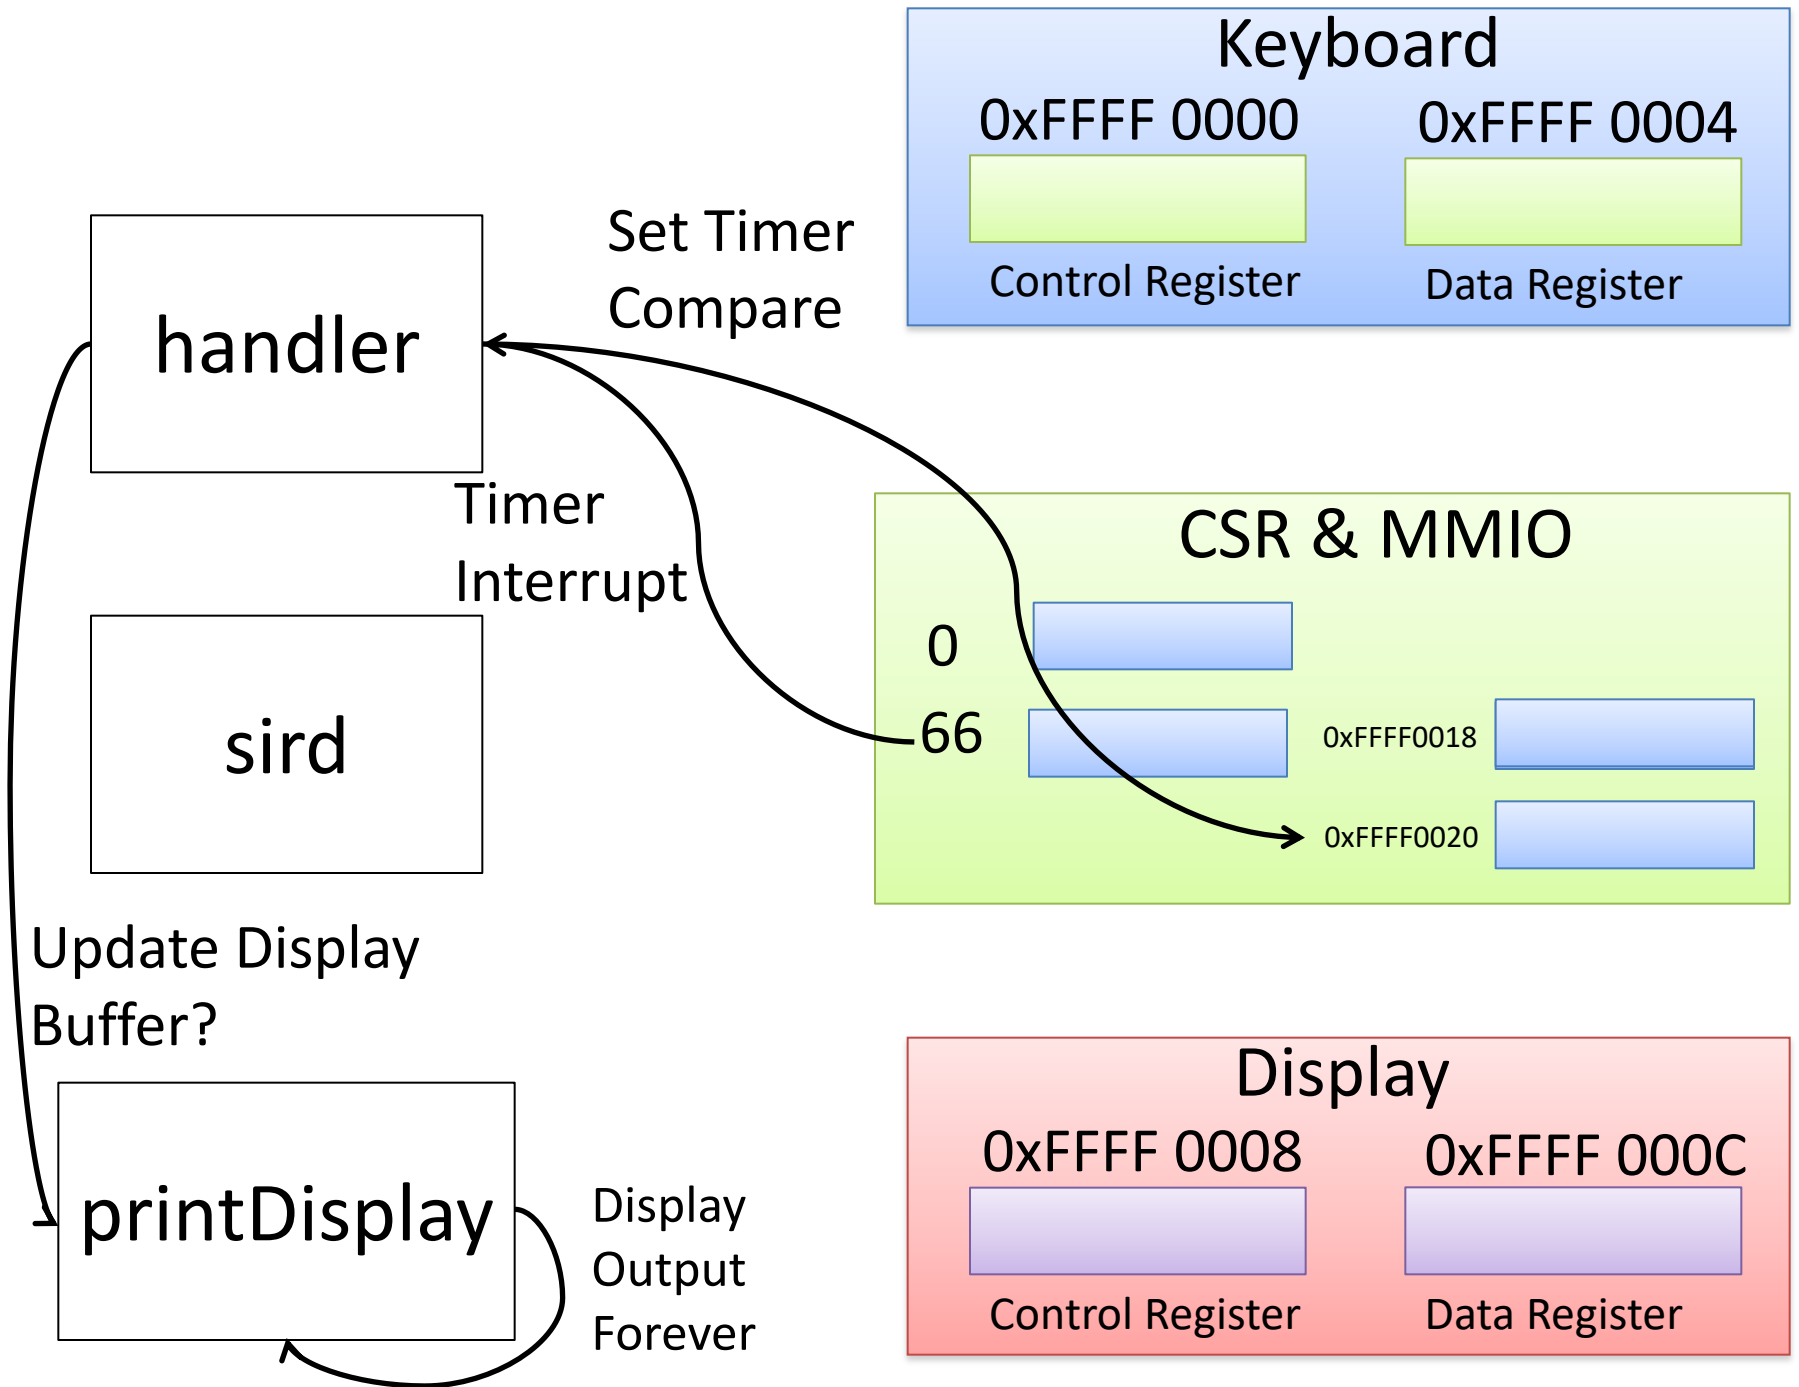

CSR & MMIO

p = address of first character
FOREVER:

With this solution the timer will be blinking

Saving Registers

- An interrupt handler must save all the registers it uses so that the program can resume execution when the handler returns.
- The label `iTrapData` designates a section of memory allocated for saving registers in the handler.
- Outside of the handler, `uscratch` (CSR #64) should contain the address of the `iTrapData` section.
- Use the `cssrw` instruction to swap a register with the `uscratch` and save all the required registers.

Saving Registers (Sample Code)
